Online (Zoom), December 2021

# Explanation of the title: Graded rings and homogeneity

## Definition (Graded ring)

Let  $G$  be a group and  $R$  a ring. We say that  $R$  is a  $G$ -graded ring if there is a collection of additive subgroups  $\{R_g\}_{g \in G}$  satisfying

- 1  $R = \bigoplus_{g \in G} R_g$ , and
- 2  $R_g R_h \subseteq R_{gh}$ , for all  $g, h \in G$ .

## Definition (Homogeneity)

- An element  $r \in R$  is called *homogeneous* if  $r \in R_g$  for some  $g \in G$ .
- An ideal  $I$  of  $R$  is called *graded* (or *homogeneous*) if  $I = \bigoplus_{g \in G} (I \cap R_g)$ .

## Acknowledgement and a warning!

This talk is based on joint work with  
Abolfazl Tarizadeh (University of Maragheh).  
arXiv:2108.10235 [math.AC]

### Warning

In this talk **ring** means **commutative ring**!

# Outline

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups

# McCoy's theorem

## Theorem (McCoy)

*If  $f$  is a zero-divisor element of the polynomial ring  $R[x]$ , then  $cf = 0$  for some nonzero  $c \in R$ .*

The following well-known conclusion can also easily be proved directly.

## Corollary

*If  $R$  is an integral domain, then  $R[x]$  is an integral domain.*

## Theorem (McCoy)

*If  $f$  is a zero-divisor element of the polynomial ring  $R[x_1, \dots, x_d]$ , then  $cf = 0$  for some nonzero  $c \in R$ .*

# Armendariz' theorem

## Theorem (Armendariz)

*Let  $f, g$  be elements of the polynomial ring  $R[x]$ . Then  $fg$  is nilpotent if and only if the product of any coefficient of  $f$  with any coefficient of  $g$  is nilpotent.*

# The starting point

## Remark

$R[x]$  is naturally  $\mathbb{Z}$ -graded:  $R[X] = \bigoplus_{n \in \mathbb{Z}} S_n$  where

- $S_n := Rx^n$  for  $n \geq 0$ , and
- $S_n := \{0\}$  for  $n < 0$ .

## Remark

$S := R[x_1, \dots, x_d]$  is naturally  $\mathbb{Z}^d$ -graded:

Indeed,  $S = \bigoplus_{(n_1, \dots, n_d) \in \mathbb{Z}^d} S_{(n_1, \dots, n_d)}$  where

- $S_{(n_1, \dots, n_d)} := Rx_1^{n_1} x_2^{n_2} \dots x_d^{n_d}$  for  $(n_1, \dots, n_d) \geq 0$ ,
- $S_{(n_1, \dots, n_d)} := \{0\}$  whenever  $n_i < 0$  for some  $i$ .

## Question

*Can McCoy's and Armendariz' theorems be generalized to the setting of  $G$ -graded rings?*

## An observation

### Example

Let  $G$  be a group containing an element  $g \neq e$  such that  $g^n = e$  for some  $n \in \mathbb{Z}^+$ . Then

$$(g - e)(g^{n-1} + g^{n-2} + \dots + g^1 + g^0) = 0$$

in any group ring  $R[G]$ . This means that  $g - e$  is a zero-divisor in  $R[G]$ . But there is no nonzero element  $c \in R$  such that  $c \cdot (g - e) = 0$ .

### Conclusion

If we want to generalize McCoy's theorem to  $G$ -graded rings, then we need to restrict ourselves to groups which are **torsion-free**!

# Totally ordered abelian groups

## Definition

An abelian group  $G$  is said to be *totally ordered* or *linearly ordered* if it is equipped with a total ordering  $\leq$  such that if  $a \leq b$  for some  $a, b \in G$ , then  $a + c \leq b + c$  for all  $c \in G$ .

## Example

- $G = (\mathbb{Z}, +)$
- $G = (\mathbb{R}, +)$
- $G = (\mathbb{Z}^d, +)$ , with the lexicographical ordering
- $G = (\mathbb{R}^d, +)$ , with the lexicographical ordering

## Remark

From now on  $G$  will denote an arbitrary **totally ordered abelian group!**

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem**
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups

# Annihilators

## Theorem (Tarizadeh & Öinert)

*Let  $I$  be an ideal of a  $G$ -graded ring  $R$ . If  $\text{Ann}_R(I) \neq 0$ , then there exists a nonzero homogeneous  $g \in R$  such that  $gI = 0$ .*

## Corollary

*If  $f$  is a zero-divisor element of a  $G$ -graded ring  $R$ , then there exists a nonzero homogeneous  $g \in R$  such that  $fg = 0$ .*

## Corollary (McCoy's theorem)

*If  $f$  is a zero-divisor element of the polynomial ring  $R[x_1, \dots, x_d]$ , then  $cf = 0$  for some nonzero  $c \in R$ .*

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem**
- 4 The Jacobson radical
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups

# The Jacobson radical and the nilradical

## Definition

- The *Jacobson radical* of  $R$ :

$$\mathfrak{J}(R) := \bigcap_{\mathfrak{m} \in \text{Max}(R)} \mathfrak{m}$$

- The *nilradical* of  $R$ :

$$\mathfrak{N}(R) := \bigcap_{\mathfrak{m} \in \text{Prime}(R)} \mathfrak{m}$$

More concretely,  $\mathfrak{N}(R) := \{r \in R \mid r^m = 0 \text{ for some } m \in \mathbb{Z}^+\}$ .

## Remark

$\mathfrak{N}(R)$  is a **graded ideal** of  $R$ , and  $\mathfrak{N}(R) \subseteq \mathfrak{J}(R)$ .

# Radical ideals

## Definition

An ideal  $I$  of a ring  $R$  is called a *radical ideal* if  $I = \sqrt{I}$ , i.e.  $I = \{r \in R \mid r^n \in I \text{ for some } n \in \mathbb{Z}^+\}$ .

## Remark

$\mathfrak{N}(R)$  and  $\mathfrak{J}(R)$  are **radical ideals** of  $R$ .

## Ideal quotients and graded ideals

### Remark

Let  $I$  and  $J$  be ideals of a ring  $R$ . The *ideal quotient*,  $I :_R J = \{f \in R : fJ \subseteq I\}$  is an ideal of  $R$  containing  $I$ .

### Remark

If  $I$  **and**  $J$  are graded ideals of  $R$ , then  $I :_R J$  is a graded ideal of  $R$ .

### Theorem (Tarizadeh & Öinert)

Let  $I$  be a **graded radical ideal** of a  $G$ -graded ring  $R$  and  $J$  an **arbitrary ideal** of  $R$ . Then  $I :_R J$  is a graded ideal.

### Corollary

If  $I$  is an ideal of a  $G$ -graded ring  $R$ , then  $\mathfrak{N}(R) :_R I$  is a graded ideal.

## Nilpotent elements

### Corollary

*Let  $f = \sum_{i \in G} f_i$  and  $g = \sum_{k \in G} g_k$  be elements of a  $G$ -graded ring  $R$ . Then  $fg$  is nilpotent if and only if  $f_i g_k$  is nilpotent for all  $i, k \in G$ .*

### Corollary (Armendariz' theorem in several variables)

*Let  $R$  be a ring and let  $f, g$  be elements of the polynomial ring  $R[x_1, \dots, x_d]$ . Then  $fg$  is nilpotent if and only if the product of any coefficient of  $f$  with any coefficient of  $g$  is nilpotent.*

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical**
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups

## Graded ideals

Theorem (Bergman, Tarizadeh & Öinert)

*The Jacobson radical of a  $G$ -graded ring is a graded ideal.*

Recall that  $\mathfrak{J}(R)$  is a radical ideal!

Corollary

*If  $I$  is an ideal of a  $G$ -graded ring  $R$ , then  $\mathfrak{J}(R) :_R I$  is a graded ideal.*

Corollary

*Let  $f = \sum_{i \in G} f_i$  and  $g = \sum_{k \in G} g_k$  be elements of a  $G$ -graded ring  $R$ . Then  $fg \in \mathfrak{J}(R)$  if and only if  $f_i g_k \in \mathfrak{J}(R)$  for all  $i, k \in G$ .*

- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical
- 5 Idempotents**
- 6 A characterization of totally ordered abelian groups

# Idempotents

## Theorem (Tarizadeh, Öinert)

*Every idempotent element of a  $G$ -graded ring  $R$  is contained in  $R_0$ .*

## Corollary

*If  $R$  is a  $G$ -graded ring such that  $R_0$  has no non-trivial idempotent, then  $R$  has no non-trivial idempotent.*

- 1 Classical results for polynomial rings
- 2 Generalizations of McCoy's theorem
- 3 Generalizations of Armendariz' theorem
- 4 The Jacobson radical
- 5 Idempotents
- 6 A characterization of totally ordered abelian groups**

# Totally ordered abelian groups

## Theorem (Tarizadeh & Öinert, Levi)

*For an abelian group  $H$  the following assertions are equivalent:*

- (i)  $H$  is a totally ordered group.*
- (ii)  $H$  is torsion-free.*
- (iii) The Jacobson radical of **every**  $H$ -graded ring is a graded ideal.*
- (iv) Every idempotent of **every**  $H$ -graded ring  $R$  is contained in  $R_0$ .*

The end

THANK YOU FOR YOUR ATTENTION!
